Introduction

Let A be a C^* -algebra with centre Z(A). If I is a (closed two-sided) ideal of A, it is immediate that

$$(Z(A)+I)/I = q_I(Z(A)) \subseteq Z(A/I), \tag{1}$$

where $q_I : A \rightarrow A/I$ is the canonical map.

Introduction

Let A be a C^* -algebra with centre Z(A). If I is a (closed two-sided) ideal of A, it is immediate that

$$(Z(A)+I)/I = q_I(Z(A)) \subseteq Z(A/I), \tag{1}$$

where $q_I : A \rightarrow A/I$ is the canonical map.

A C^* -algebra A is said to have the *centre-quotient property* (CQ-property) if for any ideal I of A, equality holds in (1).

Introduction

Let A be a C^* -algebra with centre Z(A). If I is a (closed two-sided) ideal of A, it is immediate that

$$(Z(A)+I)/I = q_I(Z(A)) \subseteq Z(A/I), \tag{1}$$

where $q_I : A \rightarrow A/I$ is the canonical map.

A C^* -algebra A is said to have the *centre-quotient property* (CQ-property) if for any ideal I of A, equality holds in (1).

In the unital case we have the following beautiful characterization of CQ-property due to Vesterstrøm.

Theorem (Vesterstrøm 1971)

If A is a unital C^* -algebra, then the following conditions are equivalent:

(i) A has the CQ-property.

(ii) A is weakly central, that is for any pair of maximal ideals M and N of A, $M \cap Z(A) = N \cap Z(A)$ implies M = N.

• Weakly central C*-algebras were introduced by Misonou and Nakamura in 1951, in the unital context.

(日) (四) (日) (日) (日)

- Weakly central C*-algebras were introduced by Misonou and Nakamura in 1951, in the unital context.
- The most prominent examples of weakly central C*-algebras A are those satisfying the *Dixmier property*, that is for each x ∈ A the closure of the convex hull of the unitary orbit of x intersects Z(A) (Archbold 1972). In particular, von Neumann algebras are weakly central (Dixmier 1949, Misonou 1952).

By CQ(A) we denote the set of all CQ-elements of A. Obviously A has the CQ-property if and only if CQ(A) = A.

Proposition

CQ(A) is a self-adjoint subset of A that is closed under scalar multiplication and contains $Z(A) + J_{wc}(A)$. Moreover, CQ(A) contains all commutators [a, b] = ab - ba $(a, b \in A)$, quasi-nilpotent elements and products by quasi-nilpotent elements. In particular, CQ(A) = Z(A) if and only if A is abelian.

- V_A^2 is the set of all $a \in A$ for which there exist $M_1, M_2 \in Max(A)$ and scalars $\lambda_1 \neq \lambda_2$ such that $Z(A) \nsubseteq M_i, M_1 \cap Z(A) = M_2 \cap Z(A)$ and $a + M_i = \lambda_i \mathbb{1}_{A/M_i}$ (i = 1, 2).

If A is a C^* -algebra then all commutators belong to CQ(A). Let [A, A] be the linear span of all commutators of A and $\overline{[A, A]}$ its norm-closure. We now characterise when CQ(A) contains $\overline{[A, A]}$ (using a result of Pop 2002).

Theorem (Archbold-G. 2020)

If A is a C^{*}-algebra then $A \setminus CQ(A) = V_A^1 \cup V_A^2$, where:

- V_A^1 is the set of all $a \in A$ for which there exists $M \in Max(A)$ such that $Z(A) \subseteq M$ and a + M is a non-zero scalar in A/M,
- V_A^2 is the set of all $a \in A$ for which there exist $M_1, M_2 \in Max(A)$ and scalars $\lambda_1 \neq \lambda_2$ such that $Z(A) \nsubseteq M_i, M_1 \cap Z(A) = M_2 \cap Z(A)$ and $a + M_i = \lambda_i \mathbb{1}_{A/M_i}$ (i = 1, 2).

If A is a C^* -algebra then all commutators belong to CQ(A). Let [A, A] be the linear span of all commutators of A and $\overline{[A, A]}$ its norm-closure. We now characterise when CQ(A) contains $\overline{[A, A]}$ (using a result of Pop 2002).

Theorem (Archbold-G. 2020)

Let A be a C^* -algebra that is not weakly central.

(a) If for all $M \in T_A$, A/M admits a tracial state then $\overline{[A, A]} \subseteq CQ(A)$.

(b) If there is M ∈ T_A such that A/M does not admit a tracial state, then [A, A] ⊈ CQ(A).

If A is a postliminal C^{*}-algebra or an AF-algebra, then $\overline{[A,A]} \subseteq CQ(A)$.

< □ > < 同 > < 回 > < 回 > < 回 >

If A is a postliminal C^{*}-algebra or an AF-algebra, then $\overline{[A, A]} \subseteq CQ(A)$.

As already mentioned, CQ(A) always contains $Z(A) + J_{wc}(A)$. The next result in particular demonstrates that CQ(A) is a C^* -subalgebra of A if and only if $CQ(A) = Z(A) + J_{wc}(A)$. In fact, when this does not hold, CQ(A) fails dramatically to be a C^* -algebra.

If A is a postliminal C^{*}-algebra or an AF-algebra, then $\overline{[A, A]} \subseteq CQ(A)$.

As already mentioned, CQ(A) always contains $Z(A) + J_{wc}(A)$. The next result in particular demonstrates that CQ(A) is a C^* -subalgebra of A if and only if $CQ(A) = Z(A) + J_{wc}(A)$. In fact, when this does not hold, CQ(A) fails dramatically to be a C^* -algebra.

Theorem (Archbold-G. 2020)

Let A be a C^* -algebra. The following conditions are equivalent:

- (i) CQ(A) is closed under addition.
- (ii) CQ(A) is closed under multiplication.
- (iii) CQ(A) is norm-closed.

(iv)
$$\operatorname{CQ}(A) = Z(A) + J_{wc}(A)$$
.

(v) $A/J_{wc}(A)$ is abelian.

イロト イボト イヨト イヨト

If A is a postliminal C^* -algebra or an AF-algebra, then the conditions (i)-(v) of previous theorem are also equivalent to:

(vi) For any $x \in CQ(A)$, $x^n \in CQ(A)$ for all $n \in \mathbb{N}$.

< □ > < 同 > < 回 > < 回 > < 回 >

If A is a postliminal C^* -algebra or an AF-algebra, then the conditions (i)-(v) of previous theorem are also equivalent to:

(vi) For any $x \in CQ(A)$, $x^n \in CQ(A)$ for all $n \in \mathbb{N}$.

Example

Let $B \neq \mathbb{C}$ be any unital simple projectionless C^* -algebra (e.g. the Jiang-Su algebra \mathcal{Z}) and let A be the C^* -algebra of all cts. functions $x : [0,1] \rightarrow M_2(B)$, such that $x(1) = \operatorname{diag}(b(x),0)$, for some $b(x) \in B$. If $M := C_0([0,1), M_2(B))$, then $M \in \operatorname{Max}(A)$ is (weakly) central so

$$T_A = T_A^1 = \{M\}, \qquad J_{wc}(A) = M$$
 and

 $CQ(A) = \{x \in A : b(x) \text{ is not a non-zero scalar}\}.$

As $A/J_{wc}(A) \cong B$ is non-abelian, CQ(A) is not norm-closed and is neither closed under addition nor under multiplication. On the other hand (as B is projectionless), for each $x \in CQ(A)$ and $n \in \mathbb{N}$ we have $x^n \in CQ(A)$.

An analogous definition of the CQ-property makes sense for purely algebraic objects like groups, rings or algebras.

A (1) > A (2) > A

An analogous definition of the CQ-property makes sense for purely algebraic objects like groups, rings or algebras.

Definition (Bešar-G. 2019)

An algebra A over a field \mathbb{F} is said to be *centrally stable (CS)* if for any ideal I of A we have (Z(A) + I)/I = Z(A/I).

▲ □ ▶ ▲ 三 ▶ ▲ 三

An analogous definition of the CQ-property makes sense for purely algebraic objects like groups, rings or algebras.

Definition (Bešar-G. 2019)

An algebra A over a field \mathbb{F} is said to be *centrally stable (CS)* if for any ideal I of A we have (Z(A) + I)/I = Z(A/I).

In contrast to the CQ-property for C^* -algebras, central stability turns out (expectedly) to be a more delicate property to deal with:

A (10) < A (10) < A (10) </p>

An analogous definition of the CQ-property makes sense for purely algebraic objects like groups, rings or algebras.

Definition (Bešar-G. 2019)

An algebra A over a field \mathbb{F} is said to be *centrally stable (CS)* if for any ideal I of A we have (Z(A) + I)/I = Z(A/I).

In contrast to the CQ-property for C^* -algebras, central stability turns out (expectedly) to be a more delicate property to deal with:

• It can easily happen that only central elements of a unital noncommutative algebra *A* are CS.
