< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Dulac or almost regular germs

#### Definition [Ilyashenko].

Parabolic almost regular germ (Dulac germ):

- $f \in C^{\infty}(0,d)$
- extends to a holomorphic germ f to a standard quadratic domain Q:

$$Q = \Phi(\mathbb{C}_+ \setminus \overline{K(0,R)}), \ \Phi(\eta) = \eta + C(\eta+1)^{\frac{1}{2}}, \ C, \ R > 0,$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

in the *logarithmic chart*  $\xi = -\log z$ .

## Standard quadratic domain

$$r_k := r(\varphi_k) \sim e^{-C\sqrt{\frac{|k|\pi}{2}}}, \ k \to \pm \infty,$$
  
$$\varphi_k \in \left( (k-1)\pi, \ (k+1)\pi \right)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

f admits the Dulac asymptotic expansion:

$$\begin{split} f(z) \sim_{z \to 0} 1 \cdot z + \sum_{k=1}^{\infty} z^{\alpha_i} P_i(-\log z), \\ \text{i.e.} \ f(z) - z - \sum_{i=1}^n z^{\alpha_i} P_i(-\log z) = O(z^{\alpha_n}), \ n \in \mathbb{N}, \end{split}$$

- $\alpha_i > 1$ , strictly increasing to  $+\infty$ ,
- $\alpha_i$  finitely generated <sup>1</sup>,
- ► *P<sub>i</sub>* polynomials.
- ▶  $\mathbb{R}_+$  invariant under f (i.e. coefficients of  $\widehat{f}$  real!)

<sup>1</sup>There exist  $\beta_k$ ,  $k = 1 \dots n$ , such that:  $\alpha_i \in \mathbb{N}\beta_1 + \dots + \mathbb{N}\beta_n = \dots = 0$ 

## Motivation and history

- ► first return maps for polycycles with hyperbolic saddle singular points - n saddle vertices with hyperbolicity ratios β<sub>i</sub> > 0 (Dulac)
- locally at the saddle

$$egin{cases} \dot{x} = x + {\sf h.o.t.} \ \dot{y} = -eta_i y + {\sf h.o.t} \end{cases}$$

## Motivation and history

- Dulac's problem: accumulation of limit cycles on a hyperbolic polycycle possible?
- limit cycles = fixed points of the first return map
- Dulac: accumulation ⇒ trivial power-log asymptotic expansion of the first return map ⇒ trivial germ on ℝ<sub>+</sub> (Dulac's mistake)
- ► the problem: Dulac asymptotic expansion does not uniquely determine f on ℝ<sub>+</sub> (add any exponentially small term w.r.t. x!), e.g.

 $f(x) \sim x + x^2 - \log x, \ f(x) + e^{-1/x} \sim x + x^2 - \log x, \ x \to 0$ 

- Ilyashenko's solution: first return maps extendable to a SQD
- SQD sufficiently large complex domain: by a variant of maximum modulus principle (*Phragmen-Lindelöf*), Dulac's expansion uniquely determines the germ on a SQD!

### Questions

 $\star$  goal: theory like the standard theory of Birkhoff, Ecalle, Voronin, Kimura, Leau etc. for parabolic analytic germs  $\mathrm{Diff}(\mathbb{C},0)$ 

 formal classification of parabolic Dulac germs – by a sequence (!!! not necesarily convergent) of formal power-logarithmic changes of variables

$$\widehat{g} = \widehat{\varphi}^{-1} \circ \widehat{f} \circ \widehat{\varphi},$$

 $\widehat{f},\widehat{g}$  Dulac expansions,  $\widehat{\varphi}(z)=z+h.o.t.$  diffeo- with power-log asymptotic expansion

analytic classification of parabolic Dulac germs

$$g=\varphi^{-1}\circ f\circ\varphi,$$

 $f,\ g$  Dulac germs on  $Q,\ \varphi(z)=z+o(z)$  analytic on Q

•  $\varphi$  admits  $\widehat{\varphi}$  as its asymptotic expansion?

 simpler question: is a Dulac germ analytically embeddable in a flow of an analytic vector field ξ(z) d/dz defined on a standard quadratic domain? (= describe *trivial* analytic class)

$$g = \varphi^{-1} \circ f_0 \circ \varphi,$$

 $f, f_0$  Dulac germs,  $f_0$  time-one map of an analytic vector field,  $\varphi$  analytic.

Example

 $f(z) = z + z^2 + z^3 + \ldots = \frac{z}{1-z}$  time-one map of  $z^2 \frac{d}{dy}$ .

## Historical results - germs of *parabolic analytic diffeomorphisms*

(Fatou  $\sim$  end of  $19^{th}$  century; Birkhoff $\sim 1950$ ; Ecalle, Voronin $\sim 1980, \ldots$ )

$$f \in \mathsf{Diff}(\mathbb{C}, 0), \ f(z) = z + a_1 z^{k+1} + a_2 z^{k+2} + \dots, \quad k \in \mathbb{N}$$

Formal embedding

= formal reduction to a time-one map of a vector field:

$$f_0(z) = \mathsf{Exp}(\frac{z^{k+1}}{1+\rho z^k}\frac{d}{dx}).$$
id  $= z + z^{k+1} + (\rho + \frac{k+1}{2})z^{2k+1} + \dots$ 

*Step-by-step* elimination of monomials from *f*:

 $\varphi_{\ell}(z) = \begin{cases} az, \ a \neq 1, \\ z + cz^{\ell}, \ \ell \in \mathbb{N} \end{cases} \leftrightarrow \widehat{\varphi}(z) = az + \sum_{k=2}^{\infty} c_k z^k \in \mathbb{C}[[z]] \\ \text{(formal changes of variables)} \end{cases}$ 

 $\Rightarrow \ (k,\rho), \ k \in \mathbb{N}, \ \rho \in \mathbb{C} \dots \text{ formal invariants for } f.$ 

## Historical results - germs of analytic diffeomorphisms

• Is f analytically embeddable, or just formally?  $\leftrightarrow$  Does  $\hat{\varphi}$  converge to an analytic function at 0?

#### Leau-Fatou flower theorem (1987):

 $\star~2k$  analytic conjugacies  $\varphi_i$  of f to  $f_0$ , all expanding in  $\widehat{\varphi}$   $\star$  defined on 2k petals invariant under local discrete dynamics

 $\star~k$  attracting directions:  $(-a_1)^{-\frac{1}{k}};~k$  repelling directions:  $a_1^{-\frac{1}{k}}$ 

$$k=3
ightarrow$$
6 petals,  $f(z)=z+z^4+\dots$ 

 $\to$  in general, analytic embedding in a flow **only on open sectors**  $\to$  the analytic class of f in direct relation with this question

#### FORMAL CLASSIFICATION OF DULAC GERMS

# Formal embedding into flows for Dulac germs (non-analytic at 0)

• elimination **term-by-term** by an *adapted* 'sequence' of non-analytic *elementary changes of variables*:

 $\varphi(z) = az; \ \varphi_{\alpha,m}(z) = z + cz^{\alpha} \ell^m, \ m \in \mathbb{Z}, \ \alpha > 0, \ (\alpha, m) \succ (1, 0).$ Example (MRRZ, 2016) 0.  $f(z) = z - z^2 \ell^{-1} + z^2 + z^3$ . 1.  $\varphi_1(z) = z + c_1 z \boldsymbol{\ell}, \ c_1 \in \mathbb{C}.$  $f_1(z) = \varphi_1^{-1} \circ f \circ \varphi_1(z) = z - z^2 \ell^{-1} + a_1 z^2 \ell + h.o.t,$ 2.  $\varphi_2(z) = z + c_2 z \ell^2, \ c_2 \in \mathbb{R},$  $f_2(z) = \varphi_2^{-1} \circ f \circ \varphi_2(z) = z + z^2 \ell^{-1}$  $+a_{2}z^{2}\ell^{2}+h.o.t.$ 3.  $\varphi_3(z) = z + c_3 z \ell^3, \ c_3 \in \mathbb{R},$  $f_3(z) = \varphi_2^{-1} \circ f \circ \varphi_3(z) = z + z^2 \ell^{-1}$  $+a_{2}z^{2}\ell^{3}+h.o.t.$ 

## The visualisation of the reduction procedure

the control of the support!

The description of the formal change of variables

more than just a *formal series composition* of changes of variables: a transfinite composition, → produces a transseries φ̂:
 \* in the process, prove that *every change has its successor change* \* prove the *formal convergence* of composition of changes of variables: by transfinite induction<sup>1</sup> in the *formal topology*<sup>2</sup>

<sup>1</sup> a generalization of the mathematical induction from  $\mathbb{N}$  to ordinal numbers: existence of a *successor element* and a *limit element*, <sup>2</sup> i.e. in each step of composition the support remains well-ordered; the coefficient of each monomial in the support stabilizes in the course of composition.

A broader class closed to embeddings: the class of power-log transseries  $\widehat{\mathcal{L}}$ 

...contains both the Dulac germ expansions  $f\mapsto \widehat{f}$  and the formal changes of variables

$$\widehat{\mathcal{L}} \dots \ \widehat{f}(z) = \sum_{\alpha \in S} \sum_{k=N_{\alpha}}^{\infty} a_{\alpha,k} z^{\alpha} \boldsymbol{\ell}^{k}, \ a_{\alpha,k} \in \mathbb{R}, \ N_{\alpha} \in \mathbb{Z},$$
$$S \subseteq (0, \infty) \text{ well-ordered (here: finitely gen.)}$$

Similarly we define  $\widehat{\mathcal{L}}_2, \ \widehat{\mathcal{L}}_3$ , etc. and

$$\widehat{\mathfrak{L}} := \cup_{k \in \mathbb{N}} \widehat{\mathcal{L}}_k.$$

(iterated logarithms admitted!)

Theorem (Formal embedding theorem for Dulac germs, MRRZ 2016)

 $\widehat{f}(z) = z - az^{\alpha} \ell^m + h.o.t.$  parabolic Dulac, a > 0,  $\alpha > 1$ ,  $m \in \mathbb{N}_-$ .  $\Rightarrow$  formally in  $\widehat{\mathcal{L}}$  conjugated to:

$$f_0(z) = \exp\left(\frac{-z^{\alpha}\boldsymbol{\ell}^m}{1 - \frac{\alpha}{2}z^{\alpha-1}\boldsymbol{\ell}^k + (\frac{k}{2} - \rho)z^{\alpha-1}\boldsymbol{\ell}^{k+1}}\frac{d}{dz}\right).\mathrm{id} =$$
$$= z - z^{\alpha}\boldsymbol{\ell}^m + \rho z^{2\alpha-1}\boldsymbol{\ell}^{2m+1} + h.o.t.$$

\*  $(\alpha, m, \rho)$ ,  $\rho \in \mathbb{R}$ ... formal invariants for Dulac germ \*  $f_0(z)$  a time-one map of an analytic vector field on SQD  $(\mathbb{Q}_+)$ 

#### Example continued

#### Example (continued)

$$f_0(z) = \exp\left(-\frac{z^2 \ell^{-1}}{1 - z \ell^{-1} + (b - \frac{1}{2})z}\right). \text{id} = z - z^2 \ell^{-1} + bz^3 \ell^{-1} + h.o.t.,$$

 $f_0 = \widehat{\varphi}^{-1} \circ \widehat{f} \circ \widehat{\varphi}, \ \ \widehat{\varphi} \in \widehat{\mathcal{L}}$  – a *transfinite* change of variables

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

#### ANALYTIC CLASSIFICATION OF DULAC GERMS

Choice of analytic conjugacy - analytic on standard quadratic domain

**Definition [MRR, in progress]** f and g Dulac on SQD Q are *analytically conjugated* if there exists

• 
$$\varphi(z) = z + o(z)$$
 analytic on  $Q$ 

$$\blacktriangleright g = \varphi^{-1} \circ f \circ \varphi \text{ on } Q.$$

 $\begin{array}{l} \Rightarrow \varphi \text{ admits asymptotic expansion in } \widehat{\mathfrak{L}} \\ \Rightarrow f \text{ and } g \text{ formally conjugated in } \widehat{\mathcal{L}} \Rightarrow \text{expansion in } \widehat{\mathcal{L}} \subset \widehat{\mathfrak{L}}. \end{array}$ 

Another possible classification:  $\varphi \in \mathbb{R}\{z\}$  (non-ramified)

The (formal) Fatou coordinate and Abel equation " = " (formal) embedding in a vector field

'Equivalent' problems:

1. (formal) conjugation of f to  $f_0$  (time-one map of an analytic vector field)

- 2. (formal) Fatou coordinate for f
- $\begin{array}{ll} \Psi(f(z))-\Psi(z)=1 & \mbox{(Abel equation)}\\ \widehat{\Psi}(\widehat{f}(z))-\widehat{\Psi}(z)=1 & \mbox{(formal Abel equation)} \end{array}$

 $\Psi=\Psi_0\circ\varphi,\ \widehat{\Psi}=\Psi_0\circ\widehat{\varphi}$ 

Historical results - construction of the Ecalle-Voronin moduli of analytic classification for  ${\rm Diff}(\mathbb{C},0)$ 

\* simplest formal class 
$$(k = 1, \rho = 0)$$
;  
 $f_0(z) = \operatorname{Exp}(z^2 \frac{d}{dz}) = \frac{z}{1-z}$ 

$$\star \ f \in \mathsf{Diff}(\mathbb{C},0), \ f(z) = z + z^2 + z^3 + o(z^3)$$

$$\Psi(f(z)) - \Psi(z) = 1$$
 (Abel equation)

Fatou, 1919:

- unique (up to aditive constant) formal solution  $\widehat{\Psi}(z) \in -1/z + z\mathbb{C}[[z]],$
- unique (up to aditive constant) analytic solutions  $\Psi_{\pm}(z)$  on petals  $V_{\pm}$
- $\Psi_{\pm}$  admit  $\widehat{\Psi}(z)$  as asymptotic expansion
  - $\rightarrow$  Fatou coordinates, sectorial trivialisations

Ecalle-Voronin moduli of analytic classification for  $\text{Diff}(\mathbb{C},0)$ 

*Ecalle, Voronin*: spaces of attr./repelling orbits (spheres!) "glued" at closed orbits (poles!) by 2 germs of diffeomorphisms:

$$\begin{split} \varphi_0(t) &:= e^{-2\pi i \Psi_- \circ (\Psi^+)^{-1} \left(-\frac{\log t}{2\pi i}\right)}, \ t \approx 0, \\ \varphi_\infty(t) &:= e^{-2\pi i \Psi_+ \circ (\Psi^-)^{-1} \left(-\frac{\log t}{2\pi i}\right)}, \ t \approx \infty \end{split}$$

Ecalle-Voronin moduli of analytic classification for  ${\rm Diff}(\mathbb{C},0)$ 

Identifications:

$$\left(\varphi_0(t),\varphi_\infty(t)\right) \equiv \left(a\varphi_0(bt),\frac{1}{b}\varphi_\infty(\frac{t}{a})\right), \ a,b \in \mathbb{C}^*$$

(choice of constant in  $\Psi_{\pm}$ , i.e. coordinates on spheres)

**Theorem Ecalle-Voronin**: After identifications,  $(\varphi_0, \varphi_\infty)$  are analytic invariants.

**Realisation theorem**: Each pair  $(\varphi_0, \varphi_\infty)$  tangent to identity can be *realized as E-V modulus* of a germ from the model formal class.

Trivial modulus  $(id, id) \leftrightarrow$  analytically embeddable germs

## Invariant domains (petals) for the local dynamics of a parabolic Dulac germ

#### L-F-like theorem, Dulac germs [MRR, in progress].

 $f(z) = z + az^{\alpha} \ell^m + \dots$  Dulac germ on a SQD Q,  $a \in \mathbb{R}$ ,  $\alpha > 1$ ,  $m \in \mathbb{N}_-$ .

 $\Rightarrow$  countably many overlapping attracting/repelling petals  $V_i^\pm,\ i\in\mathbb{Z},$  of opening  $\frac{2\pi}{\alpha-1}$ 

 $\Rightarrow$  centered at complex directions

$$(-\operatorname{sgn}(a))^{\frac{1}{\alpha-1}}(\operatorname{attracting}), \ (\operatorname{sgn}(a))^{\frac{1}{\alpha-1}}(\operatorname{repelling})$$

(invariant lines for f tangential to these directions at 0)

Sketch of the proof. In the chart  $w = -\frac{1}{a(\alpha-1)}z^{-\alpha+1}\ell^{-m}$  f almost translation by 1, easier construction of invariant domain.

## Dynamics of a Dulac germ (logarithmic chart)

・ロト ・ 一 ト ・ モト ・ モト

э

 $f(z) = z + a z^{\alpha} \ell^m + \dots, \ a < 0$ 

## (Formal) Fatou coordinate of a Dulac germ

#### Theorem [MRRZ2 (2019), MRRp (in progress)]

f Dulac on SQD Q,  $\widehat{f}$  its Dulac expansion.

- unique (up to an additive constant) formal Fatou coordinate  $\widehat{\Psi}$  for  $\widehat{f}$  in class  $\widehat{\mathfrak{L}}$  (in  $\widehat{\mathcal{L}}_2$ )
- unique (up to additive constants) analytic Fatou coordinates  $\Psi_i^{\pm}$ ,  $j \in \mathbb{Z}$ , on attracting/repelling petals  $V_i^{\pm}$
- Ψ<sub>j</sub><sup>±</sup> admit Ψ̂ as transserial asymptotic expansion with respect to integral sums on limit ordinal steps as z → 0 on V<sub>j</sub><sup>±</sup>

Caution! Transserial asymptotic expansion is not well-defined (unique), if we do not prescribe a canonical summation method on limit ordinal steps (dictated here by Abel equation)!

Non-uniqueness of asymptotic expansion of a germ in  $\widehat{\mathcal{L}}$ 

 $\rightarrow$  ambiguity: choice of the sum in  $\ell$  at limit ordinal steps

#### Example

$$f(z) = z + z^2 \frac{\ell}{1-\ell} + z^5$$

Some possible asymptotic expansions:

$$\widehat{f}_1(z) = z + z^2 (\ell + \ell^2 + \ell^3 + \ldots) + z^5$$

$$\widehat{f}_2(z) = z + z^2 (\ell + \ell^2 + \ell^3 + \ldots) - z^3 + z^5, \text{ etc.}$$

•  $\widehat{f}_1$ : canonical (convergent sum) at the first limit ordinal step:

$$\boldsymbol{\ell} + \boldsymbol{\ell}^2 + \boldsymbol{\ell}^3 + \ldots \mapsto \frac{\boldsymbol{\ell}}{1 - \boldsymbol{\ell}}$$

$$\bullet \quad \hat{f}_2: \ \boldsymbol{\ell} + \boldsymbol{\ell}^2 + \boldsymbol{\ell}^3 + \ldots \mapsto \frac{\boldsymbol{\ell}}{1 - \boldsymbol{\ell}} + e^{-\frac{3}{\boldsymbol{\ell}}} \quad \left(z = e^{-1/\boldsymbol{\ell}}\right)$$

Moreover: (?) canonical choice if series in  $\ell$  was **divergent** (the case in the Fatou coordinate)

## Sketch of the proof / method of summation $f(z) \sim \hat{f}(z) = z + z^{\alpha_1} P_1(-\log z) + z^{\alpha_2} P_2(-\log z) + \dots$

solve (formal) Abel equation by blocks

$$\widehat{\Psi}(z+z^{\alpha_1}P_1(\boldsymbol{\ell}^{-1})+\ldots)-\widehat{\Psi}(z)=1$$

•  $\widehat{\Psi}(z) := \sum z^{\beta_i} \widehat{T}_i(\ell)$ 

• In each step,  $\widehat{T}_i$  obtained solving one differential equation:

$$\begin{split} \frac{d}{dz} \Big( z^{\beta_i} \widehat{T}_i(\boldsymbol{\ell}) \Big) &:= z^{\beta_i - 1} R(\boldsymbol{\ell}), \\ (*) \ \widehat{T}_i(\boldsymbol{\ell}) &= z^{-\beta_i} \int z^{\beta_i - 1} R(\boldsymbol{\ell}) dz, \end{split}$$

 $\beta_i$  a finite combination of  $\alpha_i$ ; R a rational function in  $\ell$ .

• (\*) solvable analytically  $(T_i \text{ analytic on } Q)$  as well as formally  $(\widehat{T}_i \in \mathbb{C}[[z]])$  by partial integration  $\rightarrow$  principle of summation at limit ordinal steps:  $\widehat{T}_i \mapsto T_i$ (integral sum)

- $\widehat{\Psi} := \Psi_{\infty} + \widehat{R}$ , where  $\Psi_{\infty}$  contains *only finitely many* infinite blocks
- analytic Fatou coordinate on petals: *iterative summation* of the Abel equation along the orbit of *f*/*f*<sup>-1</sup>, after subtracting sufficiently many blocks:

$$R(f(z)) - R(z) = \delta(z),$$

 $\delta(z)$  of arbitrarily small order.

$$\Rightarrow \ R^j_{\pm}(z) := -\sum_{k=0}^{\infty} \delta(f^{\circ(\pm)k}(z)), \ j \in \mathbb{Z}.$$

Converges locally uniformly on petals  $V_{\pm}^{j}$ .

Q.E.D.

Example of blocks computation in the Fatou coordinate of a Dulac germ

#### Example

$$f(z) = z + z^2 \ell^{-1} + z^3 \implies \Psi(z + z^2 \ell^{-1} + z^3) - \Psi(z) = 1. \; (*)$$

Computation of the first block of  $\Psi$  by formal T. expansion of  $(\ast)$ :

$$\Psi_0'(z) z^2 \ell^{-1} = 1 \; \Rightarrow \; \Psi_0(z) = \int z^{-2} \ell \, dz$$

- Integration by parts: \$\hat{\Psi}\_0(z) = z^{-1} \sum\_{n \in \mathbb{N}} n! \ell\$<sup>n</sup>
   (divergent series in \ell\$ in the first block!)
- Analytic integration on SQD:  $\Psi_0(z) = \int_*^z y^{-2} \ell(y) \, dy$
- ? appropriate sum of divergent series above ? integral sum

$$\sum_{n} n! \ell^n \mapsto \frac{\int_*^z y^{-2} \ell(y) \, dy}{z^{-1}}$$

## Ecalle-Voronin moduli for Dulac germs

- $\blacktriangleright$  infinitely many attracting/repelling petals indexed by  $\mathbb Z$
- neighboring spheres glued at closed orbits by a germ of a diffeomorphism
- infinite necklace of spheres (spaces of orbits on petals), not closed

э

## Ecalle-Voronin moduli for Dulac germs

#### **Theorem E-V for Dulac maps** (MRRp)

f and g Dulac in the same  $\widehat{\mathcal{L}}$ -formal class  $(\alpha, m, \rho)$ .

► analytic invariants given by a sequence of diffeomorphisms of 0 and ∞ tangent to the identity, up to identifications (\*)

$$\begin{split} \varphi_0^i(t) &:= e^{-2\pi i \Psi_+^{i-1} \circ (\Psi_-^i)^{-1} (-\frac{\log t}{2\pi i})}, \ t \approx 0\\ \varphi_\infty^i(t) &:= e^{-2\pi i \Psi_-^i \circ (\Psi_+^i)^{-1} (-\frac{\log t}{2\pi i})}, \ t \approx \infty, \ \frac{i \in \mathbb{Z}}{2\pi i} \end{split}$$

radii of definition (at least)

$$|t| < R_i \sim K_1 e^{-K e^{C\sqrt{i}}}, \ i \to \infty$$
 (SQD)

identifications (\*)

$$(\varphi_0^i, \varphi_\infty^i; R_i)_{i \in \mathbb{Z}} \equiv (\psi_0^i, \psi_\infty^i; \tilde{R}_i)_{i \in \mathbb{Z}}$$

if  $R_i$ ,  $\tilde{R}_i$  bounded as above (possibly different constants) and there exist sequences  $(a_i)_{i\in\mathbb{Z}}$ ,  $(b_i)_{i\in\mathbb{Z}}$  in  $\mathbb{C}^*$  such that

$$\varphi_0^i(t) = a_{i-1} \cdot \psi_0^i\left(\frac{t}{b_i}\right), \ \varphi_\infty^i(t) = b_i \cdot \psi_\infty^i\left(\frac{t}{a_i}\right), \ i \in \mathbb{Z}.$$

▶ necklace symmetric w.r.t.  $\mathbb{R}_+$ -axis *Proof: Schwarz's reflection lemma*,  $f(\mathbb{R}_+) \subseteq \mathbb{R}_+ \Rightarrow \overline{f(\overline{z})} = f(z).$ 

 $\star$  f embeddable analytically on SQD in a vector field  $\leftrightarrow$  modulus trivial,  $(\dots, \mathrm{id}, \mathrm{id}, \dots)$ 

### Perspectives and comments

- realization of moduli in wider generalized Dulac class
- what can be realized really by Dulac corner maps of one saddle or by first return maps of more saddle polycycles (expected: *periodicity* of modules after finitely many)
