### Reduced generators for $\mathcal{F}(3)^{S_3}$

We employ the same strategy of:

- diagonalizing the action of the 3-cycle.
- Writing down generators in the changed basis.
- Looking for classical relations, which are easier to find due to the anti-commutativity.

Lifting the classical relations to reduce the generating set.

#### Theorem (P)

For  $c \neq -\frac{1}{2}$ , the orbifold  $(V_{N=3}(c,0) \otimes \mathcal{F})^{\mathbb{Z}_2}$  is minimally generated by the fields  $j^0, j^{\pm}, L, W_{0,0}^{+,,0}, W_{0,0}^{-,,0}, W_{0,0}^{+,,-}, \omega_{1,0}, w_{0,0}^0, w_{1,0}^0, w_{0,0}^{\pm}, w_{0,0}^{\pm}$ , and  $w_{0,0}^{\pm}$  and is of type  $(1^3, 2^4, 3^6)$ .

This follows from the explicit decoupling relations above.

# $(V_{N=3}(c,0)\otimes \mathcal{F})^{\mathbb{Z}_2}$

We now consider the special case when c = -2, which will be important later in the talk. In this case, we can check that  $T = L - L_{sug}$ , where

$$\mathcal{L}_{sug} = \frac{3}{16} \overset{\circ}{_{\scriptscriptstyle o}} j^0 j^0 \overset{\circ}{_{\scriptscriptstyle o}} + \frac{3}{4} \overset{\circ}{_{\scriptscriptstyle o}} j^+ j^- \overset{\circ}{_{\scriptscriptstyle o}} - \frac{3}{8} \partial j^0,$$

$$+ \frac{1}{4}{}_{\circ}^{\circ}\partial j^+\partial j^+{}_{\circ}^{\circ} + \frac{1}{8}{}_{\circ}^{\circ}\partial^2 j^+j^+{}_{\circ}^{+}$$

allow us to eliminate all remaining vectors of the form  $W_{0,a}^{i,j}$  for  $i, j \in \{0, +, -\}$  from the strong generating set.

 $(V_{N=3}(c,0)\otimes \mathcal{F})^{\mathbb{Z}_2}$ 

Now, equations such as

$$w_{1,0}^{+} = T_0 w_{0,0}^{+} + \frac{3}{4} \dot{j}^0 w_{0,0}^{+} - \frac{3}{4} \dot{j}^+ w_{0,0}^0,$$

will allow us to remove the fields  $w_{1,0}^i$  for  $i \in \{0, +, -\}$ . Observe that we may replace the generator  $\omega_{1,0}$  with the field

$$\tilde{L} = L_{sug} + 3\omega_{1,0},$$

The algebra  $\mathcal{W}^k(\mathfrak{sl}(4), f)$  is of type (1, 1, 1, 2, 2, 2, 2) and is strongly generated by

 $J^0, J^+, and J^-$ 

which generate a sub VOA isomorphic to  $V^{2k+4}(\mathfrak{sl}(2))$ , L, which is a Virasoro vector of central charge

$$c = -\frac{12k^2 + 41k + 32}{k+4},$$

and three remaining vectors of weight 2: H, E, and F.

Some levels collapse to the  $\mathfrak{sl}(2)$  sub-VOA.
