Introduction

For a curve *C* over a field *k*, the gonality $gon_k C$ is the least degree of a non-constant morphism $f : C \to \mathbb{P}^1$ defined over *k*. Abramovich gave a lower bound for the gonality over \mathbb{C} for any modular curve.

Theorem (Abramovich; 1996)

Let $\Gamma \subset SL_2(\mathbb{Z})$ be a congruence subgroup and X_{Γ} the corresponding modular curve. Let $D_{\Gamma} = [SL_2(\mathbb{Z}) : \Gamma]$ and let $d_{\mathbb{C}}(X_{\Gamma})$ be a \mathbb{C} -gonality of X_{Γ} . Then

$$\frac{1}{800}D_{\Gamma}\leq d_{\mathbb{C}}(X_{\Gamma}).$$

This bound is usually not sharp.

・ 何 ト ・ ヨ ト ・ ヨ ト …

The modular curve $X_0(N)$ corresponds to the congruence subgroup

$$\Gamma_0(N) = \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathsf{SL}_2(\mathbb{Z}) : \begin{bmatrix} a & b \\ c & d \end{bmatrix} \equiv \begin{bmatrix} * & * \\ 0 & * \end{bmatrix} \pmod{N} \right\}.$$

The noncuspidal points of $X_0(N)$ represent classes $[(E, C_N)]$, where E is an elliptic curve with a cyclic Galois-invariant subgroup C_N of order N. We study the gonalities of the modular curves $X_0(N)$ over \mathbb{Q} and \mathbb{C} . The cases when the \mathbb{C} -gonality is ≤ 4 have already been determined.

The modular curve $X_0(N)$ corresponds to the congruence subgroup

$$\Gamma_0(N) = \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathsf{SL}_2(\mathbb{Z}) : \begin{bmatrix} a & b \\ c & d \end{bmatrix} \equiv \begin{bmatrix} * & * \\ 0 & * \end{bmatrix} \pmod{N} \right\}.$$

The noncuspidal points of $X_0(N)$ represent classes $[(E, C_N)]$, where E is an elliptic curve with a cyclic Galois-invariant subgroup C_N of order N. We study the gonalities of the modular curves $X_0(N)$ over \mathbb{Q} and \mathbb{C} . The cases when the \mathbb{C} -gonality is ≤ 4 have already been determined.

Theorem

The modular curve $X_0(N)$ is isomorphic to \mathbb{P}^1 (i.e. of genus 0) if and only if

 $N \in \{1, \ldots, 10, 12, 13, 16, 18, 25\}.$

Theorem

The modular curve $X_0(N)$ is elliptic (i.e. of genus 1) if and only if

 $N \in \{11, 14, 15, 17, 19, 20, 21, 24, 27, 32, 36, 49\}.$

Theorem (Ogg; 1974)

The modular curve $X_0(N)$ is hyperelliptic if and only if

 $N \in \{22, 23, 26, 28, 29, 30, 31, 33, 35, 37, 39, 40, 41, 46, 47, 48, 50, 59, 71\}.$

Theorem (Hasegawa, Shimura; 1999)

The modular curve $X_0(N)$ has \mathbb{C} -gonality equal to 3 if and only if

 $N \in \{34, 38, 43, 44, 45, 53, 54, 61, 64, 81\}.$

Theorem (Jeon, Park; 2005)

The modular curve $X_0(N)$ has \mathbb{C} -gonality equal to 4 if and only if

72, 73, 74, 7577, 78, 79, 80, 83, 85, 87, 88, 89, 91, 92, 94, 95, 96, 98, 99, 100, 101, 103, 104, 107, 109, 111, 119, 121, 125, 131, 142, 143, 167, 191

The question of determining the trigonal and tetragonal curves over $\mathbb Q$ as well as the pentagonal curves over $\mathbb Q$ and $\mathbb C$ naturally arises.

< □ > < /□ >

3

The question of determining the trigonal and tetragonal curves over \mathbb{Q} as well as the pentagonal curves over \mathbb{Q} and \mathbb{C} naturally arises.

Theorem (O., Najman)

The modular curve $X_0(N)$ has \mathbb{Q} -gonality equal to 3 if and only if

 $N \in \{34, 43, 45, 54, 64, 81\}.$

The modular curve $X_0(N)$ has \mathbb{Q} -gonality equal to 4 if and only if

$$\begin{split} N \in \{ 38, 42, 44, 51, 52, 53, 55, 56, 57, 58, 60, 61, 62, 63, 65, 66, 67, 68, 69, 70, \\ 72, 73, 74, 75, 77, 78, 79, 80, 83, 85, 87, 88, 89, 91, 92, 94, 95, 96, 98, \\ 100, 101, 103, 104, 107, 111, 119, 121, 125, 131, 142, 143, 167, 191 \} \end{split}$$

The modular curve $X_0(N)$ has \mathbb{Q} -gonality equal to 5 if and only if N = 109.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Further, we determine the \mathbb{Q} -gonality of $X_0(N)$ for all N < 150 except 135, 145 and some N larger than 150. For many of those curves we also determine the \mathbb{C} -gonality.

As a byproduct of our results, we obtain that $X_0(N)$ is pentagonal over \mathbb{C} for N = 97,169, the first known such curves.

A lot of our results rely on extensive computations in Magma. The codes that verify our computations can be found on:

https://github.com/orlic1/gonality_X0.

Lower bounds

In this section we give the results used to obtain lower bounds for the gonality of $X_0(N)$. We first mention the obvious inequality

 $\operatorname{gon}_{\mathbb{C}} C \leq \operatorname{gon}_{\mathbb{Q}} C.$

→ Ξ →

Lower bounds

In this section we give the results used to obtain lower bounds for the gonality of $X_0(N)$. We first mention the obvious inequality

 $\operatorname{gon}_{\mathbb{C}} C \leq \operatorname{gon}_{\mathbb{Q}} C.$

Proposition

For a curve C over \mathbb{Q} and a rational prime p of good reduction of C, the following inequality holds:

 $\operatorname{gon}_{\mathbb{F}_p} C \leq \operatorname{gon}_{\mathbb{Q}} C.$

For a curve $X_0(N)$, the primes of good reduction are all p not dividing N.

Proposition

Let $f : X \to Y$ be a non-constant morphism over k of degree d. Then

$$\operatorname{gon}_k Y \leq \operatorname{gon}_k X \leq d \cdot \operatorname{gon}_k Y.$$

Proposition (Castelnuovo-Severi inequality)

Let k be a perfect field and let X, Y, Z be curves over k. Let non-constant morphisms $f : X \to Y$ and $g : X \to Z$ over k be given of degrees m and n, respectively. Assume that there is no morphism $X \to X'$ over k of degree > 1 through which both f and g factor. Then

 $g(x) \leq m \cdot g(Y) + n \cdot g(Z) + (m-1)(n-1).$

Fields of characteristic 0 (such as \mathbb{Q} and \mathbb{C}) and finite fields \mathbb{F}_q are perfect.

Proposition (Castelnuovo-Severi inequality)

Let k be a perfect field and let X, Y, Z be curves over k. Let non-constant morphisms $f : X \to Y$ and $g : X \to Z$ over k be given of degrees m and n, respectively. Assume that there is no morphism $X \to X'$ over k of degree > 1 through which both f and g factor. Then

 $g(x) \leq m \cdot g(Y) + n \cdot g(Z) + (m-1)(n-1).$

Fields of characteristic 0 (such as \mathbb{Q} and \mathbb{C}) and finite fields \mathbb{F}_q are perfect.

Proposition

Let X be a curve and p a prime of good reduction for X. Suppose $X(\mathbb{F}_q) > d(q+1)$ for some d. Then $gon_{\mathbb{Q}}(X) \ge d+1$.

Proof.

Let $f \in \mathbb{F}_q(X)$ be a function of degree $\leq d$. Then for any $c \in \mathbb{P}^1(\mathbb{F}_q)$ we have $\#f^{-1}(c) \leq d$. Since f sends $X(\mathbb{F}_q)$ into $\mathbb{P}^1(\mathbb{F}_q)$, it follows that $\#X(\mathbb{F}_q) \leq d(q+1)$, contradiction.

Theorem (Hasegawa, Shimura; 1999)

If the modular curve $X_0(N)$ has \mathbb{C} -gonality equal to 4 then $N \leq 191$. If the modular curve $X_0(N)$ has \mathbb{C} -gonality equal to 5 then $N \leq 197$.

For $N \ge 198$ the \mathbb{Q} and \mathbb{C} -gonality are $\ge 6 \implies$ there are only finitely many possible pentagonal curves.

Jeon and Park have determined all curves $X_0(N)$ with \mathbb{C} -gonality equal to 4. The question of finding all curves $X_0(N)$ with \mathbb{C} -gonality equal to 5 is still open.

イロト 不得 とくき とくき とうき

Let C be a smooth curve over a field k. A divisor on C is a finite linear combination of points on C with integer coefficients. The degree of a divisor is a sum of its coefficients.

Let C be a smooth curve over a field k. A divisor on C is a finite linear combination of points on C with integer coefficients. The degree of a divisor is a sum of its coefficients.

The divisor of a function $f: C \to \mathbb{P}^1$ is defined as

$$\mathsf{div}(f) = \sum_{P \in C} \mathsf{ord}_P(f) P$$

where $\operatorname{ord}_P(f)$ is the order of vanishing of f at P (negative if P is a pole).

Let C be a smooth curve over a field k. A divisor on C is a finite linear combination of points on C with integer coefficients. The degree of a divisor is a sum of its coefficients.

The divisor of a function $f: C \to \mathbb{P}^1$ is defined as

$$\operatorname{div}(f) = \sum_{P \in C} \operatorname{ord}_P(f)P$$

where $\operatorname{ord}_P(f)$ is the order of vanishing of f at P (negative if P is a pole). A divisor D is principal if there exists a function f such that $\operatorname{div}(f) = P$. Note that every principal divisor has degree 0. Divisors D_1 and D_2 are linearly equivalent if $D_1 - D_2$ is principal.

A (1) < A (1) < A (1) </p>

Riemann-Roch spaces

Let D be a divisor on a smooth curve f. The Riemann-Roch space of D, denoted by L(D), is the set of all functions $f : C \to \mathbb{P}^1$ such that

 $\operatorname{div}(f) + D \geq 0.$

This set is a finite-dimensional vector space, we denote its dimension by $\ell(D)$.

Riemann-Roch spaces

Let D be a divisor on a smooth curve f. The Riemann-Roch space of D, denoted by L(D), is the set of all functions $f : C \to \mathbb{P}^1$ such that

 $\operatorname{div}(f) + D \geq 0.$

This set is a finite-dimensional vector space, we denote its dimension by $\ell(D)$.

Theorem (Riemann-Roch)

Let X be a smooth curve of genus g with a divisor D and a canonical divisor K. Then

$$\ell(D) - \ell(K - D) = \deg(D) - g + 1.$$

Mordell-Weil sieving

We use this method for solving the cases N = 97 and N = 133. Notation:

- X the curve $X_0(N)$
- Pic^d(X) divisor classes of divisors of degree d (recall that Pic⁰(X) is the Jacobian of the curve X)
- $W_d^r(X) := \{ [D] \in \operatorname{Pic}^d(X) : D \ge 0, \ell(D) \ge r+1 \}$
- $J_0(N)$ the Jacobian of $X_0(N)$
- $J_0(N)^- := (1 w_N) J_0(N)$ (w_N being the Atkin-Lehner involution)
- red_p reduction modulo p
- $\mu : \operatorname{Pic}^{d}(X) \to J_{0}(N)^{-}, \ \mu(D) = (1 w_{N})(D)$

Mordell-Weil sieving

We use this method for solving the cases N = 97 and N = 133. Notation:

- X the curve $X_0(N)$
- Pic^d(X) divisor classes of divisors of degree d (recall that Pic⁰(X) is the Jacobian of the curve X)
- $W_d^r(X) := \{ [D] \in \operatorname{Pic}^d(X) : D \ge 0, \ell(D) \ge r+1 \}$
- $J_0(N)$ the Jacobian of $X_0(N)$
- $J_0(N)^- := (1 w_N) J_0(N)$ (w_N being the Atkin-Lehner involution)
- red_p $\operatorname{reduction}$ modulo p
- $\mu : \operatorname{Pic}^{d}(X) \to J_{0}(N)^{-}, \ \mu(D) = (1 w_{N})(D)$

A curve X has a non-constant function of degree d over \mathbb{Q} only if $W^1_d(X)(\mathbb{Q}) \neq \emptyset$ (since f = c is in the Riemann-Roch space of every $D \ge 0$).

Suppose $D \in W^1_d(X)(\mathbb{Q})$ and p > 2 is a prime of good reduction for X.

We have the following commutative diagram

- $W^1_d(X)(\mathbb{F}_p)$ can be computed using Magma
- in our case $\operatorname{rank}(J_0(N)^-(\mathbb{Q})) = 0 \implies J_0(N)^-(\mathbb{Q}) \subset J_0(N)(\mathbb{Q})_{\operatorname{tors}}$
- red_p is injective on $J_0(N)(\mathbb{Q})_{\text{tors}}$
- hence $\mu(D) \in \operatorname{red}_p^{-1}(\mu(W^1_d(X)(\mathbb{F}_p)))$

The same procedure can be applied for a set S of multiple primes p > 2 of good reduction, in which case we get

$$\mu(D) \in \bigcap_{p \in S} \operatorname{red}_p^{-1}(\mu(W_d^1(X)(\mathbb{F}_p))).$$

If
$$\bigcap_{p \in S} \operatorname{red}_p^{-1}(\mu(W_d^1(X)(\mathbb{F}_p))) = \emptyset$$
 it follows that $W_d^1(X)(\mathbb{Q}) = \emptyset$.

Upper bounds

In this section we give the results used to obtain upper bounds for the gonality of $X_0(N)$.

Proposition

Let X be a curve of genus $g \ge 2$ over a field k such that $X(k) \ne \emptyset$, then $gon_k(X) \le g$. If k is algebraically closed, then $gon_k(X) \le \lfloor \frac{g+3}{2} \rfloor$.

 $X_0(N)(\mathbb{Q}) \neq \emptyset$ since for each N at least 2 cusps are defined over \mathbb{Q} . The same is true for the quotients $X_0(N)/\langle w_d \rangle$ and $X_0(N)/\langle w_{d_1}, w_{d_2} \rangle$.

くぼう くほう くほう

Proof.

We fix $P \in X(k)$. The Riemann-Roch theorem tells us that

$$\ell(K - (g - 2)P) - \ell((g - 2)P) = g - g + 1 = 1.$$

Since the divisor (g - 2)P is effective, we have $\ell((g - 2)P) \ge 1$ and $\ell(K - (g - 2)P) \ge 2$. There exists a function f such that $D := \operatorname{div}(f) + K - (g - 2)P \ge 0$. Since $\ell(D) = \ell(K - (g - 2)P) \ge 2$, there exists a non-constant function g such that $\operatorname{div}(g) + D \ge 0$. This function has degree $\le d$ because D has degree d.

Proposition

Let p be a rational prime. There exists a morphism from $X_0(pN)$ to $X_0(N)$ defined over \mathbb{Q} which is of degree p + 1 if $p \nmid N$ and of degree p if $p \mid N$.

Proof.

The map $\pi_p : X_0(pN) \to X_0(N)$ sends the point corresponding to (E, C_{pN}) , where C_{pN} is a cyclic subgroup of E of order pN, to (E, pC_{pN}) . Thus the degree of π_p is the number of points (E, X) that satisfy $\pi_p((E, X)) = (E, C_N)$ for a given a fixed subgroup C_N of E. This is equal to the number of cyclic subgroups X of $(\mathbb{Z}/pN\mathbb{Z})^2$ that satisfy $pX = C_N$, which is as claimed.

The morphisms $X_0(N) \to X_0(N)/w_d$ and $X_0(N) \to X_0(N)/\langle w_{d_1}, w_{d_2} \rangle$ defined over \mathbb{Q} of degrees 2 and 4, respectively, also give us the upper bound in many cases.

Theorem (The Tower theorem)

Let C be a curve defined over a perfect field k and $f : C \to \mathbb{P}^1$ be a non-constant morphism over \overline{k} of degree d. Then there exists a curve C' defined over k and a non-constant morphism $f' : C \to C'$ defined over k of degree d' dividing d such that

$$g(C') \leq \left(rac{d}{d'} - 1
ight)^2$$

Petar Orlić (University of Zagreb) Gonality of the modular curve $X_0(N)$ 7. 10. 2022. 18/27

Corollary

- (i) Let C be a curve defined over \mathbb{Q} with $gon_{\mathbb{C}}(X) = 3$ and $g(X) \ge 5$. Then $gon_{\mathbb{Q}}(X) = 3$.
- (ii) Let C be a curve defined over \mathbb{Q} with $gon_{\mathbb{C}}(X) = 4$ and $g(X) \ge 10$. Then $gon_{\mathbb{Q}}(X) = 4$.

Proof.

Part (i) follows immediately by specializing C' to be \mathbb{P}^1 and d to be 3. To prove part (ii) we note that C will have a map of degree d' over \mathbb{Q} dividing 4 to a curve of genus $\leq (4/d'-1)^2$, so d' cannot be 1. If d' is 2, then X is bielliptic (and is tetragonal over \mathbb{Q}). If d' is 4, then X is tetragonal over \mathbb{Q} , as required.

Jeon and Park have already proven that $gon_{\mathbb{C}} = 4$.

We construct a rational function of degree 5 by looking at the Riemann-Roch spaces of \mathbb{Q} -rational divisors of degree 5 whose support is in the quadratic points obtained by the pullbacks of rational points on $X_0^+(109)$.

(日本) (日本) (日本) 日本

22 / 27

To be precise, we found rational divisors P, Q, R such that $\deg(P) = 1$, $\deg(Q) = \deg(R) = 2$ and $\ell(P + Q + R) = 2$. Furthermore, $5 \leq \operatorname{gon}_{\mathbb{F}_3} \leq \operatorname{gon}_{\mathbb{Q}}$ and it follows that $\operatorname{gon}_{\mathbb{Q}} = 5$.

The quotient $X_0(146)/w_{146}$ is of genus 5 and trigonal over \mathbb{C} . Therefore, it is trigonal over \mathbb{Q} by the Tower theorem and $gon_{\mathbb{Q}} \leq 2 \times 3 = 6$. We know that $gon_{\mathbb{C}} \geq 5$ from the theorems in the Introduction. On the other hand, suppose that there is a map $X_0(146) \rightarrow \mathbb{P}^1$ of degree 5. Then by applying the CS-inequality we get

$$g(X_0(146)) \le 5 \cdot 0 + 2 \cdot 5 + (5-1)(2-1) \le 14$$

23 / 27

which is impossible since $g(X_0(146)) = 17$. Therefore, $gon_{\mathbb{C}} = gon_{\mathbb{Q}} = 6$.

The curve $X_0(169)$ is of genus 8. Therefore, $\operatorname{gon}_{\mathbb{C}} \leq \lfloor \frac{8+3}{2} \rfloor = 5$. Since $\operatorname{gon}_{\mathbb{C}} \geq 5$ from the theorems in the Introduction, we get $\operatorname{gon}_{\mathbb{C}} = 5$. Let us now determine the \mathbb{Q} -gonality.

The curve $X_0(169)$ is of genus 8. Therefore, $\operatorname{gon}_{\mathbb{C}} \leq \lfloor \frac{8+3}{2} \rfloor = 5$. Since $\operatorname{gon}_{\mathbb{C}} \geq 5$ from the theorems in the Introduction, we get $\operatorname{gon}_{\mathbb{C}} = 5$. Let us now determine the Q-gonality. The quotient $X_0(169)/w_{169}$ is of genus 3. Therefore, $\operatorname{gon}_{\mathbb{Q}} \leq 2 \cdot 3 = 6$. On the other hand, we have $6 \leq \operatorname{gon}_{\mathbb{F}_p} \leq \operatorname{gon}_{\mathbb{Q}}$ which implies that $\operatorname{gon}_{\mathbb{Q}} = 6$.

A (B) < A (B) < A (B) </p>

• N = 97The curve $X_0(97)$ is of genus 7. Therefore, $gon_{\mathbb{C}} \leq \lfloor \frac{7+3}{2} \rfloor = 5$. Since $gon_{\mathbb{C}} \geq 5$ from the theorems in the Introduction, we get $gon_{\mathbb{C}} = 5$. Let us now determine the Q-gonality.

3

The curve $X_0(97)$ is of genus 7. Therefore, $\operatorname{gon}_{\mathbb{C}} \leq \lfloor \frac{7+3}{2} \rfloor = 5$. Since $\operatorname{gon}_{\mathbb{C}} \geq 5$ from the theorems in the Introduction, we get $\operatorname{gon}_{\mathbb{C}} = 5$. Let us now determine the Q-gonality. The quotient $X_0(97)/w_{97}$ is of genus 3. Therefore, we have $\operatorname{gon}_{\mathbb{O}} \leq 2 \cdot 3 = 6$. For the lower bound we do the Mordell-Weil sieving. The rank of $J_0(97)^-(\mathbb{Q})$ is 0. For a prime p, $J_0(p)_{tors}^-(\mathbb{Q}) \simeq \mathbb{Z}/\frac{p-1}{12}\mathbb{Z}$ and is generated by $D_0 = [0 - \infty]$, where 0 and ∞ are the two cusps of $X_0(p)$. Therefore, $J_0(97)^-(\mathbb{Q}) \simeq \mathbb{Z}/8\mathbb{Z}$ and is generated by D_0 . We compute

$$\operatorname{red}_{3}^{-1}(\mu(W_{5}^{1}(X_{0}(97)(\mathbb{F}_{3})))) = \{0\},\$$
$$\operatorname{red}_{5}^{-1}(\mu(W_{5}^{1}(X_{0}(97)(\mathbb{F}_{5})))) = \{D_{0}, 7D_{0}\}.$$

Therefore $W_5^1(X_0(97))(\mathbb{Q}) = \emptyset$ and we get $gon_{\mathbb{Q}} = 6$.

・ 何 ト ・ ヨ ト ・ ヨ ト ・ ヨ

The rank of $J_0(97)^-(\mathbb{Q})$ is 0. For a prime p, $J_0(p)^-_{tors}(\mathbb{Q}) \simeq \mathbb{Z}/\frac{p-1}{12}\mathbb{Z}$ and is generated by $D_0 = [0 - \infty]$, where 0 and ∞ are the two cusps of $X_0(p)$. Therefore, $J_0(97)^-(\mathbb{Q}) \simeq \mathbb{Z}/8\mathbb{Z}$ and is generated by D_0 . We compute

$$\begin{aligned} \operatorname{red}_3^{-1}(\mu(W_5^1(X_0(97)(\mathbb{F}_3)))) &= \{0\}, \\ \operatorname{red}_5^{-1}(\mu(W_5^1(X_0(97)(\mathbb{F}_5)))) &= \{D_0, 7D_0\}. \end{aligned}$$

Therefore $W_5^1(X_0(97))(\mathbb{Q}) = \emptyset$ and we get $gon_{\mathbb{Q}} = 6$. Later we noticed that

$$\operatorname{red}_{7}^{-1}(\mu(W_{5}^{1}(X_{0}(97)(\mathbb{F}_{7})))) = \emptyset$$

so it was possible to do the sieving with just one prime.

くぼう くほう くほう 二日

This case is more involved than 97 because we couldn't compute the torsion group exactly.

The rank of $J_0(133)^-(\mathbb{Q})$ is 0, so $J_0(133)^-(\mathbb{Q}) \subset J_0(133)(\mathbb{Q})_{tors}$. We proved that $J_0(133)(\mathbb{Q})_{tors}$ is isomorphic to a subgroup of $\mathbb{Z}/6\mathbb{Z} \times \mathbb{Z}/360\mathbb{Z}$.

We found rational divisors A, B which generate a subgroup $T := \langle A, B \rangle \simeq \mathbb{Z}/6\mathbb{Z} \times \mathbb{Z}/180\mathbb{Z}.$

Thus it follows that for any $x \in J_0(133)^-(\mathbb{Q})$, we have $2x \in T$. Hence we use the map 2μ , sending a divisor D to 2(D - w(D)) instead of μ (which we used for 97). We compute

$$\mathsf{red}_3^{-1}(2\mu(W_7^1(X_0(133))(\mathbb{F}_3))) = \emptyset.$$

Therefore, $W_7^1(X_0(133))(\mathbb{Q}) = \emptyset$ and we get $gon_{\mathbb{Q}} = 8$.
