Continuity of generalized Riesz potentials for double phase functionals with variable exponent

Accepted manuscript

CONTINUITY OF GENERALIZED RIESZ POTENTIALS FOR DOUBLE PHASE FUNCTIONALS WITH VARIABLE EXPONENT

Takao Ohno and Tetsu Shimomura
Oita University and Hiroshima University, Japan

Abstract. In this note, we discuss the continuity of generalized Riesz potentials $I_\rho f$ of functions in Morrey spaces $L^{\Phi,\nu(\cdot)}(G)$ of double phase functionals with variable exponents.

1. Introduction

The double phase functional introduced by Zhikov ([30]) in the 1980s has been studied intensively by many mathematichans. Regarding regularity theory of differential equations, Baroni, Colombo and Mingione [1, 4, 5] studied a double phase functional

$$\tilde{\Phi}(x,t) = t^p + a(x)t^q, \ x \in \mathbf{R}^N, \ t \geq 0$$

where $N \geq 2$, $1 \leq p < q$, $a(\cdot)$ is non-negative, bounded and Hölder continuous of order $\theta \in (0,1]$. We refer to [10, 16] for Sobolev's inequality, [11] for Trudinger's inequality and e.g. [2, 7, 8] for other double phase problems.

For $0 < \alpha < N$ and a locally integrable function f on $\mathbf{R}^N$ the Riesz potential $I_\alpha f$ of order α is defined by

$$I_\alpha f(x) = \int_{\mathbf{R}^N} |x-y|^{\alpha-N} f(y)\, dy.$$

In [12] we discussed the continuity of Riesz potentials $I_\alpha f$ of functions in Morrey spaces $L^{\tilde{\Phi},\nu}(\mathbf{R}^N)$ of the double phase functionals $\tilde{\Phi}(x,t)$. We refer to [16, Section 5] for the $L^{\tilde{\Phi}}$ case and [14] for the $L^{p(\cdot),\nu(\cdot)}$ case.

2000 *Mathematics Subject Classification.* 31B15, 46E35.
Key words and phrases. Riesz potentials, Morrey spaces, double phase functionals, continuity.

In the present note, we consider the case $\Phi(x,t)$ is a double phase functional given by

$$\Phi(x,t) = t^{p(x)} + (b(x)t)^{q(x)},$$

where $p(x) < q(x)$ and $b(\cdot)$ is non-negative, bounded and Hölder continuous of order $\theta \in (0,1]$ ([10], cf. [3, 26]).

To obtain general results, we consider the family (ρ) of all functions ρ satisfying the following conditions: $\rho : (0,\infty) \to (0,\infty)$ is a measurable function such that

$$\int_0^r \rho(s)\,\frac{ds}{s} < \infty$$

for all sufficiently small $r > 0$ and there exists constants $0 < k < 1$, $0 < k_1 < k_2$ and $C_\rho > 0$ such that

$$\sup_{kr \le s \le r} \rho(s) \le C_\rho \int_{k_1 r}^{k_2 r} \rho(s)\,\frac{ds}{s} \tag{1.1}$$

for all $r > 0$ (e.g. [6, 27]). We do not postulate the doubling condition on ρ.

Example 1.1. If ρ satisfies the doubling condition, that is, there exists a constant $C > 0$ such that $C^{-1} \le \rho(r)/\rho(s) \le C$ for $1/2 \le r/s \le 2$, then ρ satisfies (1.1) whenever $k = 1/2$ and $2k_1 = k_2$. If ρ is increasing, then ρ satisfies (1.1) with $k = 1/2$, $k_1 = 1$ and $k_2 = 2$. If $\alpha \in \mathbf{R}$ such that $\rho(r) = r^\alpha e^{-1/r}$, then ρ satisfies (1.1) with $k = 1/2$, $k_1 = 1/4$ and $k_2 = 1/2$. See also [21, Lemma 2.5], [24, 27] and [28, Remark 2.2].

Let G be an open bounded set in $\mathbf{R}^N$. For a function $\rho \in (\rho)$, we define the generalized Riesz potential $I_\rho f$ of f by

$$I_\rho f(x) = \int_G \frac{\rho(|x-y|) f(y)}{|x-y|^N}\,dy,$$

where $f \in L^1(G)$. We write $I_\rho f = I_\alpha f$ when $\rho(r) = r^\alpha$, $0 < \alpha < N$. We refer to [15, 22, 23, 25, 29] etc. for the study of $I_\rho f$.

Our aim in this note is to study the continuity of generalized Riesz potential $I_\rho f$ of functions f in Morrey spaces $L^{\Phi,\nu(\cdot)}(G)$ of the double phase functionals with variable exponents (Theorem 2.2), as an extension of [12, Theorem 4.1].

2. Definitions and the main Theorem

Throughout this paper, let C denote various constants independent of the variables in question and log be a natural logarithm.

Let $p(\cdot)$ be a measurable functions on G such that

(P1) $1 \le p^- := \inf_{x\in G} p(x) \le \sup_{x\in G} p(x) =: p^+ < \infty$, (P2) $p(\cdot)$ is log-Hölder continuous on G, namely

$$|p(x)-p(y)| \le \frac{C_p}{\log(e+1/|x-y|)} \quad (x,\, y \in G)$$

with a constant $C_p \ge 0$.

Let $\nu(\cdot)$ be a measurable functions on G such that

$$0 < \nu^- := \inf_{x\in G} \nu(x) \le \sup_{x\in G} \nu(x) =: \nu^+ < \infty.$$

Let $B(x,r)$ denote the open ball centered at $x \in \mathbf{R}^N$ with radius $r > 0$. For a set $E \subset \mathbf{R}^N$, $|E|$ denotes the Lebesgue measure of E. Set $d_G = \sup\{|x-y| : x, y \in G\}$. Morrey space with variable exponents $L^{p(\cdot),\nu(\cdot)}(G)$ is the family of measurable functions f on G satisfying

$$L^{p(\cdot),\nu(\cdot)}(G) = \Big\{ f \in L^1_{loc}(G)\,; \sup_{x\in G, 0<r<d_G} \frac{r^{\nu(x)}}{|B(x,r)|} \int_{G\cap B(x,r)} |f(y)|^{p(y)}\, dy < \infty \Big\}.$$

It is a Banach space with respect to the norm

$$\|f\|_{L^{p(\cdot),\nu(\cdot)}(G)} = \inf\Big\{ \lambda > 0\,; \sup_{x\in G, 0<r<d_G} \frac{r^{\nu(x)}}{|B(x,r)|} \int_{G\cap B(x,r)} \left(\frac{|f(y)|}{\lambda}\right)^{p(y)} dy \le 1 \Big\}$$

(cf. see [19]).

We consider a function $\Phi(x,t) : G \times [0,\infty) \to [0,\infty)$ satisfying the following conditions ($\Phi1$) and ($\Phi2$):

($\Phi1$) $\Phi(\,\cdot\,,t)$ is measurable on G for each $t \ge 0$ and $\Phi(x,\,\cdot\,)$ is convex on $[0,\infty)$ for each $x \in G$;

($\Phi2$) there exists a constant $A_1 \ge 1$ such that $A_1^{-1} \le \Phi(x,1) \le A_1$ for all $x \in G$.

The Musielak-Orlicz-Morrey space $L^{\Phi,\nu(\cdot)}(G)$ is defined by

$$L^{\Phi,\nu(\cdot)}(G) = \Big\{ f \in L^1_{\rm loc}(G)\ : \sup_{x\in G, 0<r<d_G} \frac{r^{\nu(x)}}{|B(x,r)|} \int_{G\cap B(x,r)} \Phi\left(y, \frac{|f(y)|}{\lambda}\right) dy < \infty \text{ for some } \lambda > 0 \Big\}.$$

It is a Banach space with respect to the norm

$$\|f\|_{L^{\Phi,\nu(\cdot)}(G)} = \inf\Bigg\{\lambda > 0 \ : \sup_{x\in G, 0<r<d_G} \frac{r^{\nu(x)}}{|B(x,r)|}\int_{G\cap B(x,r)} \Phi\left(y, \frac{|f(y)|}{\lambda}\right)\, dy \le 1\Bigg\}$$

(see [9, 20]).

Let $q(\cdot)$ be a measurable function on G such that

(Q1) $1 \le q^- := \inf_{x\in G} q(x) \le \sup_{x\in G} q(x) =: q^+ < \infty$,

(Q2) $q(\cdot)$ is log-Hölder continuous on G, namely

$$|q(x) - q(y)| \le \frac{C_q}{\log(e + 1/|x-y|)} \quad (x,\, y \in G)$$

with a constant $C_q \ge 0$.

In what follows, set

$$\Phi(x,t) = t^{p(x)} + (b(x)t)^{q(x)},$$

where $p(x) < q(x)$ and $b(\cdot)$ is non-negative, bounded and Hölder continuous of order $\theta \in (0,1]$ ([10], cf. [3, 26]).

Remark 2.1. Let $f \in L^{\Phi,\nu(\cdot)}(G)$ be a measurable function on G. Then note that $f \in L^{p(\cdot),\nu(\cdot)}(G)$ and $bf \in L^{q(\cdot),\nu(\cdot)}(G)$.

We state the following, as an extension of [12, Theorem 4.1].

Theorem 2.2. *Let $\rho \in (\rho)$. Assume that there are constants $\eta_1 > 0, \eta_2 > 0, \tau > 0$ and $C_0 > 0$ such that*

$$\left|\frac{\rho(|x-y|)}{|x-y|^N} - \frac{\rho(|z-y|)}{|z-y|^N}\right| \le C_0 \frac{|x-z|^{\eta_1}}{|x-y|^{\eta_2}}\frac{\rho(\tau|x-y|)}{|x-y|^N} \tag{2.2}$$

whenever $x,y,z \in G$ and $|x-z| \le |x-y|/2$. Abbreviate

$$\begin{aligned}
&\psi(x,z,r)\\
&\equiv \int_0^{4k_2 r} s^{-\nu(x)/p(x)+\theta}\rho(s)\,\frac{ds}{s} + \int_0^{4k_2 r} s^{-\nu(x)/q(x)}\rho(s)\,\frac{ds}{s}\\
&+ \int_0^{6k_2 r} s^{-\nu(z)/p(z)+\theta}\rho(s)\,\frac{ds}{s} + \int_0^{6k_2 r} s^{-\nu(z)/q(z)}\rho(s)\,\frac{ds}{s}\\
&+ r^\theta \int_{k_1 r}^{4k_2 d_G} s^{-\nu(z)/p(z)}\rho(s)\,\frac{ds}{s}\\
&+ r^{\eta_1}\int_{2k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/p(x)-\eta_2+\theta}\rho(s)\,\frac{ds}{s} + r^{\eta_1}\int_{2k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/q(x)-\eta_2}\rho(s)\,\frac{ds}{s}
\end{aligned}$$

for $x, z \in G$ and $0 < r \le d_G$, where k_1 and k_2 are constants in (ρ). Assume that $\psi(x, z, r) < \infty$ for all $x, z \in G$ and $0 < r \le d_G$. Then there exists a constant $C > 0$ such that

$$|b(x)I_\rho f(x) - b(z)I_\rho f(z)| \le C\psi(x, z, |x - z|)$$

for all $x, z \in G$ and measurable functions f on G with $\|f\|_{L^{\Phi,\nu(\cdot)}(G)} \le 1$.

REMARK 2.3. Let $\rho(r) = r^\alpha e^{-1/r}$ be as in Example 1.1. Then the mean value property implies that (2.2) holds for $\eta_1 = 1, \eta_2 = 2$ and $\tau = 3/2$. Note here that there exists a constant $C \ge 1$ such that

$$C^{-1}\frac{\rho(r)}{r^{N+2}} \le \frac{d}{dr}\left(\frac{\rho(r)}{r^N}\right) \le C\frac{\rho(r)}{r^{N+2}}$$

for all $0 < r < d_G$ and $|x-y|/2 \le |x-y+t(z-x)| \le 3|x-y|/2$ for $0 \le t \le 1$ and $|x - z| \le |x - y|/2$.

REMARK 2.4. If $\rho(r)r^a$ is increasing for some $a \ge 0$ and $\rho(r)/r^b$ is decreasing for some $b \ge 0$, then ρ satisfies the doubling condition and

$$\left|\frac{\rho(r)}{r^N} - \frac{\rho(s)}{s^N}\right| \le C_0|r - s|\frac{\rho(r)}{r^{N+1}}, \quad \text{for } \frac{1}{2} \le \frac{s}{r} \le 2.$$

See [22].

3. Corollaries

In this section, we give consequences of our theorem.

COROLLARY 3.1. *Let $\rho(r) = r^\alpha(\log(e + 1/r))^\beta$ for $\alpha > 0$ and $\beta \in \mathbf{R}$. Suppose $\inf_{x\in G}(\nu(x)-\alpha p(x)) > 0$ and $\inf_{x\in G}((\alpha+\theta)p(x)-\nu(x)) > 0$. Further suppose $\inf_{x\in G}(\nu(x) - (\alpha - 1)q(x)) > 0$ and $\inf_{x\in G}(\alpha q(x) - \nu(x)) > 0$. Then there exists a constant $C > 0$ such that*

$$\begin{aligned}
&|b(x)I_\rho f(x) - b(z)I_\rho f(z)| \\
&\le C\big\{|x - z|^{\alpha-\nu(x)/p(x)+\theta} + |x - z|^{\alpha-\nu(x)/q(x)} \\
&\quad + |x - z|^{\alpha-\nu(z)/p(z)+\theta} + |x - z|^{\alpha-\nu(z)/q(z)}\big\}(\log(e + 1/|x - z|))^\beta
\end{aligned}$$

for all $x, z \in G$ and measurable functions f on G with $\|f\|_{L^{\Phi,\nu(\cdot)}(G)} \le 1$.

PROOF. Since $\inf_{x\in G}((\alpha + \theta)p(x) - \nu(x)) > 0$, taking ε_1 such that $0 < \varepsilon_1 < \alpha - \nu(x)/p(x) + \theta$, there exists a constant $c_1 > 0$ such that

$$s_1^{\alpha-\nu(x)/p(x)+\theta-\varepsilon_1}(\log(e + 1/s_1))^\beta \le c_1 s_2^{\alpha-\nu(x)/p(x)+\theta-\varepsilon_1}(\log(e + 1/s_2))^\beta$$

whenever $0 < s_1 \le s_2$ (see e.g. [17, 18]). Therefore we have

$$\int_0^{4k_2r} s^{\alpha-\nu(x)/p(x)+\theta}(\log(e+1/s))^\beta \frac{ds}{s}$$
$$\le c_1(4k_2r)^{\alpha-\nu(x)/p(x)+\theta-\varepsilon_1}(\log(e+1/(4k_2r)))^\beta \int_0^{4k_2r} s^{\varepsilon_1} \frac{ds}{s}$$
$$\le Cr^{\alpha-\nu(x)/p(x)+\theta}(\log(e+1/r))^\beta$$

and, similarly we obtain

$$\int_0^{6k_2r} s^{\alpha-\nu(z)/p(z)+\theta}(\log(e+1/s))^\beta \frac{ds}{s} \le Cr^{\alpha-\nu(z)/p(z)+\theta}(\log(e+1/r))^\beta.$$

Since $\inf_{x\in G}(\alpha q(x)-\nu(x)) > 0$, we obtain

$$\int_0^{4k_2r} s^{\alpha-\nu(x)/q(x)}(\log(e+1/s))^\beta \frac{ds}{s} \le Cr^{\alpha-\nu(x)/q(x)}(\log(e+1/r))^\beta$$

and

$$\int_0^{6k_2r} s^{\alpha-\nu(z)/q(z)}(\log(e+1/s))^\beta \frac{ds}{s} \le Cr^{\alpha-\nu(z)/q(z)}(\log(e+1/r))^\beta.$$

Since $\inf_{x\in G}(\nu(x)-\alpha p(x)) > 0$, taking ε_2 such that $0 < \varepsilon_2 < \nu(z)/p(z)-\alpha$, there exists a constant $c_2 > 0$ such that

$$s_2^{\alpha-\nu(z)/p(z)+\varepsilon_2}(\log(e+1/s_2))^\beta \le c_2 s_1^{\alpha-\nu(z)/p(z)+\varepsilon_2}(\log(e+1/s_1))^\beta$$

whenever $0 < s_1 \le s_2$, so that

$$r^\theta \int_{k_1r}^{4k_2d_G} s^{\alpha-\nu(z)/p(z)}(\log(e+1/s))^\beta \frac{ds}{s}$$
$$\le c_2r^\theta(k_1r)^{\alpha-\nu(z)/p(z)+\varepsilon_2}(\log(e+1/(k_1r)))^\beta \int_{k_1r}^{4k_2d_G} s^{-\varepsilon_2} \frac{ds}{s}$$
$$\le Cr^{\alpha-\nu(z)/p(z)+\theta}(\log(e+1/r))^\beta.$$

We also have

$$r\int_{2k_1\tau r}^{4k_2\tau d_G} s^{\alpha-\nu(x)/p(x)-1+\theta}(\log(e+1/s))^\beta \frac{ds}{s} \le Cr^{\alpha-\nu(x)/p(x)+\theta}(\log(e+1/r))^\beta$$

since $\inf_{x\in G}(\nu(x)-(\alpha+\theta-1)p(x)) \ge \inf_{x\in G}(\nu(x)-\alpha p(x)) > 0$, and

$$r\int_{2k_1\tau r}^{4k_2\tau d_G} s^{\alpha-\nu(x)/q(x)-1}(\log(e+1/s))^\beta \frac{ds}{s} \le Cr^{\alpha-\nu(x)/q(x)}(\log(e+1/r))^\beta$$

since $\inf_{x\in G}(\nu(x)-(\alpha-1)q(x)) > 0$.

Collecting these facts, we obtain by our assumptions

$$\psi(x,z,r) \le C\{r^{\alpha-\nu(x)/p(x)+\theta}+r^{\alpha-\nu(x)/q(x)}$$
$$+r^{\alpha-\nu(z)/p(z)+\theta}+r^{\alpha-\nu(z)/q(z)}\}(\log(e+1/r))^\beta < \infty$$

for $x, z \in G$ and $0 < r \le d_G$. By Theorem 2.2, we obtain the required result. $\square$

COROLLARY 3.2. *Suppose* $\inf_{x\in G}(\nu(x) - \alpha p(x)) > 0$ *and* $\inf_{x\in G}((\alpha + \theta)p(x) - \nu(x)) > 0$. *Further suppose* $\inf_{x\in G}(\nu(x) - (\alpha - 1)q(x)) > 0$ *and* $\inf_{x\in G}(\alpha q(x) - \nu(x)) > 0$. *Then there exists a constant* $C > 0$ *such that*

$$|b(x)I_\alpha f(x) - b(z)I_\alpha f(z)| \le C\big\{|x - z|^{\alpha-\nu(x)/p(x)+\theta} + |x - z|^{\alpha-\nu(x)/q(x)} + |x - z|^{\alpha-\nu(z)/p(z)+\theta} + |x - z|^{\alpha-\nu(z)/q(z)}\big\}$$

for all $x, z \in G$ *and measurable functions* f *on* G *with* $\|f\|_{L^{\Phi,\nu(\cdot)}(G)} \le 1$.

PROOF. This is the case $\beta = 0$ in Corollary 3.1. $\square$

Compare Corollaries 3.1 and 3.2 with [12, Theorem 4.1].

COROLLARY 3.3. *Let* $\rho(r) = r^\alpha e^{-1/r}$ *be as in Example 1.1. Then there exists a constant* $C > 0$ *such that*

$$|b(x)I_\rho f(x) - b(z)I_\rho f(z)| \le C|x - z|^\theta$$

for all $x, z \in G$ *and measurable functions* f *on* G *with* $\|f\|_{L^{\Phi,\nu(\cdot)}(G)} \le 1$.

PROOF. Since, for $a \in \mathbf{R}$, there exists a constant $c > 0$ such that

$$\int_0^r s^a e^{-1/s}\,\frac{ds}{s} \le cr^\theta$$

for all $0 < r \le d_G$, it follows from Remark 2.3 that

$$\psi(x, z, r) \le C(r + r^\theta) \le Cr^\theta$$

for all $x, z \in G$ and $0 < r \le d_G$, since $\theta \in (0, 1]$. Hence, we obtain the required inequality. $\square$

COROLLARY 3.4. *Let* $\rho(r) = r^\alpha(\log(e + 1/r))^\beta$ *for* $\alpha > 0$ *and* $\beta \in \mathbf{R}$. *Suppose* $\inf_{x\in G}(\nu(x) - (\alpha - 1)p(x)) > 0$ *and* $\inf_{x\in G}(\alpha p(x) - \nu(x)) > 0$. *Then there exists a constant* $C > 0$ *such that*

$$|I_\rho f(x) - I_\rho f(z)| \le C\left\{|x - z|^{\alpha-\nu(x)/p(x)} + |x - z|^{\alpha-\nu(z)/p(z)}\right\}(\log(e + 1/|x - z|))^\beta$$

for all $x, z \in G$ *and measurable functions* f *on* G *with* $\|f\|_{L^{p(\cdot),\nu(\cdot)}(G)} \le 1$.

PROOF. To show this, we take $b(\cdot) \equiv 1$ and $q(\cdot) = p(\cdot)$ in the proof of Thoerem 2.2. As in the proof of Corollary 3.1, we obtain the result. $\square$

4. Lemmas

Before giving a proof of Theorem 2.2, we prepare two lemmas. To prove the following lemma, (P2) and (Q2) were used.

Lemma 4.1 ([13, Lemma 2.1], cf. [14, Lemma 2.7]). *There exists a constant $C > 0$ such that*

$$\frac{r^{\nu(x)/p(x)}}{|B(x,r)|} \int_{G\cap B(x,r)} |f(y)|\, dy \le C$$

for all $x \in G$, $0 < r < d_G$ and measurable functions f on G with $\|f\|_{L^{p(\cdot),\nu(\cdot)}(G)} \le 1$.

Lemma 4.2. *Let $\tau > 0, \beta \in \mathbf{R}$ and $\rho \in (\rho)$. Let f be a nonnegative function on G such that $\|f\|_{L^{p(\cdot),\nu(\cdot)}(G)} \le 1$. Then there exists a constant $C > 0$ such that*

$$\int_{G\cap B(x,r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\, dy \le C \int_0^{2k_2\tau r} s^{-\nu(x)/p(x)-\beta}\rho(s)\, \frac{ds}{s} \tag{4.3}$$

and

$$\int_{G\setminus B(x,r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\, dy \le C \int_{k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/p(x)-\beta}\rho(s)\, \frac{ds}{s} \tag{4.4}$$

for all $x \in G$ and $0 < r \le d_G$, where k_1 and k_2 are constants in (ρ).

Proof. Let f be a nonnegative function on G such that $\|f\|_{L^{p(\cdot),\nu(\cdot)}(G)} \le 1$. Take $\gamma \in \mathbf{R}$ such that $1 < \gamma \le \min\{1/k, 2\}$. If $y \in G \cap (B(x,\gamma^j r) \setminus B(x,\gamma^{j-1}r))$ for $j \in \mathbf{Z}$, then a geometric observation and (1.1) show

$$\begin{aligned}\frac{\rho(\tau|x-y|)}{|x-y|^{N+\beta}} &\le \frac{\max\left\{1,\gamma^{N+\beta}\right\}}{(\gamma^j r)^{N+\beta}} \sup_{\gamma^{j-1}\tau r\le s\le\gamma^j\tau r} \rho(s)\\ &\le \frac{\max\left\{1,\gamma^{N+\beta}\right\}}{(\gamma^j r)^{N+\beta}} \sup_{k\gamma^{j}\tau r\le s\le\gamma^j\tau r} \rho(s)\\ &\le \frac{C_\rho\max\left\{1,\gamma^{N+\beta}\right\}}{(\gamma^j r)^{N+\beta}} \int_{\gamma^j k_1\tau r}^{\gamma^j k_2\tau r} \rho(s)\, \frac{ds}{s}\end{aligned}$$

by $\gamma \le 1/k$. By Lemma 4.1, we have

$$\frac{1}{|B(x,\gamma^j r)|}\int_{G\cap B(x,\gamma^j r)} f(y)\, dy \le C_1(\gamma^j r)^{-\nu(x)/p(x)}$$

for some constant $C_1 > 0$, so that

$$\begin{aligned}
&\int_{G\cap(B(x,\gamma^j r)\setminus B(x,\gamma^{j-1}r))} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\,dy \\
&\le \frac{C_\rho \sigma_N \max\left\{1,\gamma^{N+\beta}\right\}}{(\gamma^j r)^\beta} \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} \rho(s)\,\frac{ds}{s} \cdot \frac{1}{|B(x,\gamma^j r)|} \int_{G\cap B(x,\gamma^j r)} f(y)\,dy \\
&\le \frac{C_\rho \sigma_N \max\left\{1,\gamma^{N+\beta}\right\}}{(\gamma^j r)^\beta} \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} \rho(s)\,\frac{ds}{s} \cdot C_1 \left(\gamma^j r\right)^{-\nu(x)/p(x)} \\
&\le C_1 C_\rho \sigma_N \max\left\{1, 2^{N+\beta}\right\} (\gamma^j r)^{-\nu(x)/p(x)-\beta} \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} \rho(s)\,\frac{ds}{s} \\
&\le C_1 C_\rho \sigma_N \max\left\{1, 2^{N+\beta}\right\} \\
&\times \max\left\{(\tau k_1)^{\nu(x)/p(x)+\beta}, (\tau k_2)^{\nu(x)/p(x)+\beta}\right\} \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s} \\
&\le C_2 \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s},
\end{aligned}$$

where σ_N denotes the volume of the unit ball $B(0,1)$ and

$$\begin{aligned}
C_2 &= C_1 C_\rho \sigma_N \max\left\{1, 2^{N+\beta}\right\} \\
&\quad \times \max\left\{(\tau k_1)^{\nu^+/p^-+\beta}, (\tau k_1)^{\nu^-/p^++\beta}, (\tau k_2)^{\nu^+/p^-+\beta}, (\tau k_2)^{\nu^-/p^++\beta}\right\}.
\end{aligned}$$

Therefore we have

$$\int_{G\cap(B(x,\gamma^j r)\setminus B(x,\gamma^{j-1}r))} \le C_2 \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s}. \tag{4.5}$$

Let j_0 be the smallest integer such that $k_2/k_1 \le \gamma^{j_0}$. Using (4.5), we obtain

$$\begin{aligned}
&\int_{G\cap B(x,r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\,dy = \sum_{j=0}^{\infty} \int_{G\cap(B(x,\gamma^{-j} r)\setminus B(x,\gamma^{-j-1}r))} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\,dy \\
&\le C_2 \sum_{j=0}^{\infty} \int_{\gamma^{-j} k_1 \tau r}^{\gamma^{-j} k_2 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s} \le C_2 \sum_{j=0}^{\infty} \int_{\gamma^{-j} k_1 \tau r}^{\gamma^{-j+j_0} k_1 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s} \\
&\le j_0 C_2 \int_0^{2k_2 \tau r} s^{-\nu(x)/p(x)-\beta} \rho(s)\,\frac{ds}{s},
\end{aligned}$$

which proves (4.3).

Let j_1 be the smallest integer such that $d_G \le \gamma^{j_1} r$. If we use (4.5),

$$
\begin{aligned}
&\int_{G\setminus B(x,r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\,dy \le \sum_{j=1}^{j_1} \int_{G\cap(B(x,\gamma^j r)\setminus B(x,\gamma^{j-1}r))} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\beta}}\,dy \\
&\le C_2 \sum_{j=1}^{j_1} \int_{\gamma^j k_1 \tau r}^{\gamma^j k_2 \tau r} s^{-\nu(x)/p(x)-\beta}\rho(s)\,\frac{ds}{s} \\
&\le C_2 \sum_{j=1}^{j_1} \int_{\gamma^j k_1 \tau r}^{\gamma^{j+j_0} k_1 \tau r} s^{-\nu(x)/p(x)-\beta}\rho(s)\,\frac{ds}{s} \\
&\le C_2 j_0 \int_{k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/p(x)-\beta}\rho(s)\,\frac{ds}{s}.
\end{aligned}
$$

Thus, (4.4) follows. □

5. Proof of Theorem

Without loss of generality, we can assume that f is a nonnegative function on G such that $\|f\|_{L^{\Phi,\nu(\cdot)}(G)} \le 1$. First note from (2.2) that for $x, z \in G$ and $r = |x-z|$

$$
\begin{aligned}
&|b(x)I_\rho f(x) - b(z)I_\rho f(z)| \\
&\le b(x)\int_{G\cap B(x,2r)} \frac{\rho(|x-y|)f(y)}{|x-y|^N}\,dy + b(z)\int_{G\cap B(x,2r)} \frac{\rho(|z-y|)f(y)}{|z-y|^N}\,dy \\
&+ |b(x)-b(z)| \int_{G\setminus B(x,2r)} \frac{\rho(|z-y|)f(y)}{|z-y|^N}\,dy \\
&+ b(x)\int_{G\setminus B(x,2r)} \left| \frac{\rho(|x-y|)}{|x-y|^N} - \frac{\rho(|z-y|)}{|z-y|^N} \right| f(y)\,dy \\
&\le C\Bigg\{ b(x)\int_{G\cap B(x,2r)} \frac{\rho(|x-y|)f(y)}{|x-y|^N}\,dy + b(z)\int_{G\cap B(z,3r)} \frac{\rho(|z-y|)f(y)}{|z-y|^N}\,dy \\
&+ r^\theta \int_{G\setminus B(z,r)} \frac{\rho(|z-y|)f(y)}{|z-y|^N}\,dy + r^{\eta_1} b(x)\int_{G\setminus B(x,2r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N+\eta_2}}\,dy \Bigg\} \\
&= C\left\{ I_1(x) + \tilde{I}_1(z) + I_2(z) + I_3(x) \right\}.
\end{aligned}
$$

For $I_1(x)$, we have

$$\begin{aligned} I_1(x) &\le \int_{G\cap B(x,2r)} \frac{\rho(|x-y|)}{|x-y|^N}|b(x)-b(y)|f(y)\,dy \\ &+ \int_{G\cap B(x,2r)} \frac{\rho(|x-y|)}{|x-y|^N} b(y)f(y)\,dy \\ &\le C\int_{G\cap B(x,2r)} \frac{\rho(|x-y|)f(y)}{|x-y|^{N-\theta}}\,dy + \int_{G\cap B(x,2r)} \frac{\rho(|x-y|)\{b(y)f(y)\}}{|x-y|^N}\,dy \\ &= CI_{11}(x) + I_{12}(x). \end{aligned}$$

By (4.3), we obtain

$$I_{11}(x) \le C\int_0^{4k_2 r} s^{-\nu(x)/p(x)+\theta}\rho(s)\,\frac{ds}{s},$$

and

$$I_{12}(x) \le C\int_0^{4k_2 r} s^{-\nu(x)/q(x)}\rho(s)\,\frac{ds}{s}.$$

For $\tilde{I}_1(z)$, we have by (4.3)

$$\tilde{I}_1(z) \le C\left\{\int_0^{6k_2 r} s^{-\nu(z)/p(z)+\theta}\rho(s)\,\frac{ds}{s} + \int_0^{6k_2 r} s^{-\nu(z)/q(z)}\rho(s)\,\frac{ds}{s}\right\}$$

as in the estimate of $I_{11}(x)$ and $I_{12}(x)$.

For $I_2(z)$, we have by (4.4)

$$I_2(z) \le Cr^{\theta}\int_{k_1 r}^{4k_2 d_G} s^{-\nu(z)/p(z)}\rho(s)\,\frac{ds}{s}.$$

Finally, for $I_3(x)$ we have

$$\begin{aligned} I_3(x) &\le r^{\eta_1}\int_{G\setminus B(x,2r)} \frac{\rho(\tau|x-y|)}{|x-y|^{N+\eta_2}}|b(x)-b(y)|f(y)\,dy \\ &+ r^{\eta_1}\int_{G\setminus B(x,2r)} \frac{\rho(\tau|x-y|)}{|x-y|^{N+\eta_2}} b(y)f(y)\,dy \\ &\le Cr^{\eta_1}\int_{G\setminus B(x,2r)} \frac{\rho(\tau|x-y|)f(y)}{|x-y|^{N-\theta+\eta_2}}\,dy \\ &+ r^{\eta_1}\int_{G\setminus B(x,2r)} \frac{\rho(\tau|x-y|)\{b(y)f(y)\}}{|x-y|^{N+\eta_2}}\,dy \\ &= CI_{31}(x) + I_{32}(x). \end{aligned}$$

Note from (4.4) that

$$I_{31}(x) \le Cr^{\eta_1}\int_{2k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/p(x)-\eta_2+\theta}\rho(s)\,\frac{ds}{s}$$

and

$$I_{32}(x) \le Cr^{\eta_1} \int_{2k_1\tau r}^{4k_2\tau d_G} s^{-\nu(x)/q(x)-\eta_2} \rho(s) \, \frac{ds}{s}.$$

Collecting these facts, we obtain

$$|b(x)I_\rho f(x) - b(z)I_\rho f(z)| \le C\psi(x, z, r).$$

Thus this theorem is proved.

Acknowledgements.

We would like to express our thanks to the referees for their kind comments and helpful suggestions.
